- 30

said determining further comprises ascertaining whether said high watermark of a  
local address pool exceeds a high watermark limit; and

said method further comprises indicating one or more IP address pools should be  
5 reallocated to give more IP addresses to the network element associated with said  
high watermark when said high watermark exceeds said high watermark limit.

3. The method of claim 2 wherein

each said local IP address pool further comprises a low watermark that indicates the  
10 minimum number of IP addresses used by said network edge device;

said determining further comprises ascertaining whether said low watermark of said  
address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be  
reallocated to reclaim IP addresses from the network element associated with  
15 said low watermark when said low watermark exceeds said low watermark limit.

4. The method of claim 3 wherein said reallocating further comprises:

allocating an IP address from IP addresses reclaimed from other IP address pools  
when said high watermark exceeds said high watermark limit and when the  
20 number of unallocated IP addresses is insufficient;

allocating an IP addresses from unallocated IP addresses when said high watermark  
exceeds said high watermark limit and when the number of unallocated IP  
addresses is sufficient; and

reallocating one or more IP address pools to reclaim IP addresses from a local IP address pool when said high watermark is less than said high watermark limit and said low watermark is greater than said low watermark limit.

5

5. The method of claim 1 wherein

each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device;

said determining further comprises ascertaining whether said low watermark of said

10

address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be reallocated to reclaim IP addresses from the network element associated with said low watermark when said low watermark exceeds said low watermark limit.

15

6. The method of claim 3 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

said high watermark is expressed as a percentage of allocated IP addresses.

20

7. The method of claim 6 wherein said network operates according to a simple network management protocol (SNMP).

8. The method of claim 7 wherein

said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

9. A method for managing Internet Protocol (IP) addresses on a data communications network, comprising:

5 allocating a plurality of local IP address pools, each of said local IP address pools associated with a different network edge device capable of accepting connection requests requiring an IP address, said network edge device having a local memory, said local memory including a local IP address pool database; receiving a communication from said network edge device, said communication  
10 including an IP address usage summary; determining whether one or more of said plurality of local IP address pools should be adjusted based upon said IP address usage summary; and adjusting one or more of said plurality of local IP address pools based upon said determining.

15 10. The method of claim 9 wherein:

20 said local IP address pool includes a high watermark that indicates the maximum number of IP addresses used by said network edge device; said determining further comprises ascertaining whether said high watermark of a local address pool exceeds a high watermark limit; and said method further comprises indicating one or more IP address pools should be reallocated to give more IP addresses to the network element associated with said high watermark when said high watermark exceeds said high watermark limit.

11. The method of claim 10 wherein

each said local IP address pool further comprises a low watermark that indicates the  
minimum number of IP addresses used by said network edge device;

5 said determining further comprises ascertaining whether said low watermark of a said  
address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be  
reallocated to reclaim IP addresses from the network element associated with  
said low watermark when said low watermark exceeds said low watermark limit.

10

12. The method of claim 11 wherein said reallocating further comprises:

allocating an IP address from IP addresses reclaimed from other IP address pools  
when said high watermark exceeds said high watermark limit and when the  
number of unallocated IP addresses is insufficient;

15 allocating an IP addresses from unallocated IP addresses when said high watermark  
exceeds said high watermark limit and when the number of unallocated IP  
addresses is sufficient; and

reallocating one or more IP address pools to reclaim IP addresses from a local IP  
address pool when said high watermark is less than said high watermark limit  
20 and said low watermark is greater than said low watermark limit.

13. The method of claim 9 wherein

each said local IP address pool further comprises a low watermark that indicates the  
minimum number of IP addresses used by said network edge device;

said determining further comprises ascertaining whether said low watermark of said  
address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be

5 reallocated to reclaim IP addresses from the network element associated with  
said low watermark when said low watermark exceeds said low watermark limit.

14. The method of claim 11 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

10 said high watermark is expressed as a percentage of allocated IP addresses.

15. The method of claim 14 wherein said network operates according to a simple network  
management protocol (SNMP).

16. The method of claim 15 wherein

said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

17. A method for managing Internet Protocol (IP) addresses on a data communications

20 network, comprising:

receiving a communication;

allocating an available IP address from said local IP address pool if said

communication includes a connection request, said local IP address pool

associated with a different network edge device capable of accepting connection

25 requests;

determining whether said local IP address pool should be adjusted;  
sending a alarm message to an IP pool manager when said IP address pool should be  
adjusted; and  
5 storing an IP address allocation when said communication includes an IP address  
allocation.

18. The method of claim 17 wherein

said local IP address pool includes a high watermark that indicates the maximum

10 number of IP addresses used by said network edge device; and

said determining further comprises:

ascertaining whether said high watermark of a local address pool exceeds a high  
watermark limit; and

indicating one or more IP address pools should be reallocated to give more IP

15 addresses to said network edge device when said high watermark exceeds  
said high watermark limit.

19. The method of claim 18 wherein

each said local IP address pool further comprises a low watermark that indicates the

20 minimum number of IP addresses used by said network edge device; and

said determining further comprises:

ascertaining whether said low watermark of said address pool exceeds a low  
watermark limit; and

7359260

said method further comprises indicating one or more IP address pools should be reallocated to reclaim IP addresses from said network edge device when said low watermark exceeds said low watermark limit.

5

20. The method of claim 19 wherein said reallocating further comprises:

allocating an IP address from IP addresses reclaimed from other IP address pools when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is insufficient;

10

allocating an IP addresses from unallocated IP addresses when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is sufficient; and

reallocating one or more IP address pools to reclaim IP addresses from said local IP address pool when said high watermark is less than said high watermark limit and said low watermark is greater than said low watermark limit.

15

21. The method of claim 17 wherein

each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device; and

20

said determining further comprises:

ascertaining whether said low watermark of said local address pool exceeds a low watermark limit; and

indicating one or more IP address pools should be reallocated to reclaim IP addresses from the network element associated with said low watermark when said low watermark exceeds said low watermark limit.

5

22. The method of claim 19 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and  
said high watermark is expressed as a percentage of allocated IP addresses.

10 23. The method of claim 22 wherein said network operates according to a simple network management protocol (SNMP).

24. The method of claim 23 wherein

said low watermark is stored in an expression MIB; and  
15 said high watermark is stored in an expression MIB.

25. A program storage device readable by a machine, embodying a program of instructions executable by the machine to perform a method to manage Internet Protocol (IP) addresses on a data communications network, the method comprising:

20 allocating a plurality of local IP address pools, each of said local IP address pools associated with a different network edge device capable of accepting connection requests requiring an IP address, said network edge device having a local memory, said local memory including a local IP address pool database;  
requesting IP address usage data from one or more of said network edge devices;  
25 receiving said requested IP address usage data;

reallocating one or more of said plurality of local IP address pools based upon said

updating one or more of said local IP address pool databases and a global IP pool

including the information maintained in each said local IP address pool.

said local IP address pool includes a high watermark that indicates the maximum

said determining further comprises ascertaining whether said high watermark of a

15      said method further comprises indicating one or more IP address pools should be

high watermark when said high watermark exceeds said high watermark limit.

20 each said local IP address pool further comprises a low watermark that indicates the

said determining further comprises ascertaining whether said low watermark of said

address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be  
reallocated to reclaim IP addresses from the network element associated with  
said low watermark when said low watermark exceeds said low watermark limit.

5

28. The program storage device of claim 27 wherein said reallocating further comprises:

allocating an IP address from IP addresses reclaimed from other IP address pools  
when said high watermark exceeds said high watermark limit and when the  
number of unallocated IP addresses is insufficient;

10

allocating an IP addresses from unallocated IP addresses when said high watermark  
exceeds said high watermark limit and when the number of unallocated IP  
addresses is sufficient; and

reallocating one or more IP address pools to reclaim IP addresses from a local IP  
address pool when said high watermark is less than said high watermark limit  
and said low watermark is greater than said low watermark limit.

15

29. The program storage device of claim 25 wherein

each said local IP address pool further comprises a low watermark that indicates the  
minimum number of IP addresses used by said network edge device;

20

said determining further comprises ascertaining whether said low watermark of said  
address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be  
reallocated to reclaim IP addresses from the network element associated with  
said low watermark when said low watermark exceeds said low watermark limit.

30. The program storage device of claim 27 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

5      said high watermark is expressed as a percentage of allocated IP addresses.

31. The program storage device of claim 30 wherein said network operates according to a  
simple network management protocol (SNMP).

10    32. The program storage device of claim 31 wherein

said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

33. A program storage device readable by a machine, embodying a program of

15    instructions executable by the machine to perform a method to manage Internet  
Protocol (IP) addresses on a data communications network, the method comprising:  
allocating a plurality of local IP address pools, each of said local IP address pools

associated with a different network edge device capable of accepting connection  
requests requiring an IP address, said network edge device having a local

20    memory, said local memory including a local IP address pool database;

receiving a communication from said network edge device, said communication

including an IP address usage summary;

determining whether one or more of said plurality of local IP address pools should be

adjusted based upon said IP address usage summary; and

RECEIVED  
FEB 20 1994

adjusting one or more of said plurality of local IP address pools based upon said  
determining.

5 34. The program storage device of claim 33 wherein:

said local IP address pool includes a high watermark that indicates the maximum  
number of IP addresses used by said network edge device;

said determining further comprises ascertaining whether said high watermark of a  
local address pool exceeds a high watermark limit; and

10 said method further comprises indicating one or more IP address pools should be  
reallocated to give more IP addresses to the network element associated with said  
high watermark when said high watermark exceeds said high watermark limit.

35. The program storage device of claim 34 wherein

15 each said local IP address pool further comprises a low watermark that indicates the  
minimum number of IP addresses used by said network edge device;

said determining further comprises ascertaining whether said low watermark of a said  
address pool exceeds a low watermark limit; and

20 said method further comprises indicating one or more IP address pools should be  
reallocated to reclaim IP addresses from the network element associated with  
said low watermark when said low watermark exceeds said low watermark limit.

TO: T30101302200

36. The program storage device of claim 35 wherein said reallocating further comprises:

allocating an IP address from IP addresses reclaimed from other IP address pools

when said high watermark exceeds said high watermark limit and when the

5 number of unallocated IP addresses is insufficient;

allocating an IP addresses from unallocated IP addresses when said high watermark

exceeds said high watermark limit and when the number of unallocated IP

addresses is sufficient; and

reallocating one or more IP address pools to reclaim IP addresses from a local IP

10 address pool when said high watermark is less than said high watermark limit

and said low watermark is greater than said low watermark limit.

37. The program storage device of claim 33 wherein

each said local IP address pool further comprises a low watermark that indicates the

15 minimum number of IP addresses used by said network edge device;

said determining further comprises ascertaining whether said low watermark of said

address pool exceeds a low watermark limit; and

said method further comprises indicating one or more IP address pools should be

reallocated to reclaim IP addresses from the network element associated with

20 said low watermark when said low watermark exceeds said low watermark limit.

38. The program storage device of claim 35 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

said high watermark is expressed as a percentage of allocated IP addresses.

said local IP address pool includes a high watermark that indicates the maximum number of IP addresses used by said network edge device; and

ascertaining whether said high watermark of a local address pool exceeds a high watermark limit; and

10

each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device; and

15

ascertaining whether said low watermark of said address pool exceeds a low watermark limit; and

20

44. The program storage device of claim 43 wherein said reallocating further comprises:

allocating an IP address from IP addresses reclaimed from other IP address pools

when said high watermark exceeds said high watermark limit and when the

5 number of unallocated IP addresses is insufficient;

allocating an IP addresses from unallocated IP addresses when said high watermark

exceeds said high watermark limit and when the number of unallocated IP

addresses is sufficient; and

reallocating one or more IP address pools to reclaim IP addresses from said local IP

10 address pool when said high watermark is less than said high watermark limit

and said low watermark is greater than said low watermark limit.

45. The program storage device of claim 41 wherein

each said local IP address pool further comprises a low watermark that indicates the

15 minimum number of IP addresses used by said network edge device; and

said determining further comprises:

ascertaining whether said low watermark of said local address pool exceeds a low

watermark limit; and

indicating one or more IP address pools should be reallocated to reclaim IP

20 addresses from the network element associated with said low watermark

when said low watermark exceeds said low watermark limit.

46. The program storage device of claim 43 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

0075991-01401  
TOP TO: 75991-01401

said high watermark is expressed as a percentage of allocated IP addresses.

47. The program storage device of claim 46 wherein said network operates according to a

5 simple network management protocol (SNMP).

48. The program storage device of claim 47 wherein

said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

10

49. An apparatus for managing Internet Protocol (IP) addresses on a data

communications network, the apparatus comprising:

means for allocating a plurality of local IP address pools, each of said local IP address

pools associated with a different network edge device capable of accepting

15

connection requests requiring an IP address, said network edge device having a

local memory, said local memory including a local IP address pool database;

means for requesting IP address usage data from one or more of said network edge

devices;

means for receiving said requested IP address usage data;

20

means for determining whether one or more of said plurality of local IP address pools

should be reallocated based upon at least said requested IP address usage data;

means for reallocating one or more of said plurality of local IP address pools based

upon said determining; and

means for updating one or more of said local IP address pool databases and a global IP pool database based upon said reallocating, said global IP address pool database including the information maintained in each said local IP address pool.

5

50. The apparatus of claim 49 wherein

said local IP address pool includes a high watermark that indicates the maximum number of IP addresses used by said network edge device;

said means for determining further comprises means for ascertaining whether said

10 high watermark of a local address pool exceeds a high watermark limit; and

said apparatus further comprises means for indicating one or more IP address pools

should be reallocated to give more IP addresses to the network element

associated with said high watermark when said high watermark exceeds said high watermark limit.

15

51. The apparatus of claim 50 wherein

each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device;

said means for determining further comprises means for ascertaining whether said

20 low watermark of said address pool exceeds a low watermark limit; and

said apparatus further comprises means for indicating one or more IP address pools

should be reallocated to reclaim IP addresses from the network element

associated with said low watermark when said low watermark exceeds said low watermark limit.

00765981-041901  
TOP TO TABS 9260

52. The apparatus of claim 51 wherein said reallocating further comprises:

means for allocating an IP address from IP addresses reclaimed from other IP address

5 pools when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is insufficient;

means for allocating an IP addresses from unallocated IP addresses when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is sufficient; and

10 means for reallocating one or more IP address pools to reclaim IP addresses from a local IP address pool when said high watermark is less than said high watermark limit and said low watermark is greater than said low watermark limit.

53. The apparatus of claim 49 wherein

15 each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device;

said means for determining further comprises ascertaining whether said low watermark of said address pool exceeds a low watermark limit; and

said apparatus further comprises means for indicating one or more IP address pools

20 should be reallocated to reclaim IP addresses from the network element

associated with said low watermark when said low watermark exceeds said low watermark limit.

54. The apparatus of claim 51 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

said high watermark is expressed as a percentage of allocated IP addresses.

5

55. The apparatus of claim 54 wherein said network operates according to a simple network management protocol (SNMP).

56. The apparatus of claim 55 wherein

10 said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

57. An apparatus for managing Internet Protocol (IP) addresses on a data communications network, the apparatus comprising:

15 means for allocating a plurality of local IP address pools, each of said local IP address

pools associated with a different network edge device capable of accepting

connection requests requiring an IP address, said network edge device having a

local memory, said local memory including a local IP address pool database;

means for receiving a communication from said network edge device, said

20 communication including an IP address usage summary;

means for determining whether one or more of said plurality of local IP address pools

should be adjusted based upon said IP address usage summary; and

means for adjusting one or more of said plurality of local IP address pools based upon said determining.

58. The apparatus of claim 57 wherein:

said local IP address pool includes a high watermark that indicates the maximum

5 number of IP addresses used by said network edge device;

said means for determining further comprises means for ascertaining whether said

high watermark of a local address pool exceeds a high watermark limit; and

said apparatus further comprises means for indicating one or more IP address pools

should be reallocated to give more IP addresses to the network element

10 associated with said high watermark when said high watermark exceeds said high watermark limit.

59. The apparatus of claim 10 wherein

each said local IP address pool further comprises a low watermark that indicates the

15 minimum number of IP addresses used by said network edge device;

said means for determining further comprises means for ascertaining whether said

low watermark of a said address pool exceeds a low watermark limit; and

said apparatus further comprises means for indicating one or more IP address pools

should be reallocated to reclaim IP addresses from the network element

20 associated with said low watermark when said low watermark exceeds said low watermark limit.

20

66. The apparatus of claim 65 wherein

said local IP address pool includes a high watermark that indicates the maximum  
number of IP addresses used by said network edge device; and

5 said means for determining further comprises:

means for ascertaining whether said high watermark of a local address pool  
exceeds a high watermark limit; and

means for indicating one or more IP address pools should be reallocated to give  
more IP addresses to said network edge device when said high watermark  
10 exceeds said high watermark limit.

67. The apparatus of claim 66 wherein

each said local IP address pool further comprises a low watermark that indicates the  
minimum number of IP addresses used by said network edge device; and

15 said means for determining further comprises:

means for ascertaining whether said low watermark of said address pool exceeds a  
low watermark limit; and

said apparatus further comprises means for indicating one or more IP address  
pools should be reallocated to reclaim IP addresses from said network edge  
20 device when said low watermark exceeds said low watermark limit.

68. The apparatus of claim 67 wherein said reallocating further comprises:

means for allocating an IP address from IP addresses reclaimed from other IP address pools when said high watermark exceeds said high watermark limit and when the

5 number of unallocated IP addresses is insufficient;

means for allocating an IP addresses from unallocated IP addresses when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is sufficient; and

means for reallocating one or more IP address pools to reclaim IP addresses from said

10 local IP address pool when said high watermark is less than said high watermark limit and said low watermark is greater than said low watermark limit.

69. The apparatus of claim 65 wherein

each said local IP address pool further comprises a low watermark that indicates the

15 minimum number of IP addresses used by said network edge device; and

said means for determining further comprises:

means for ascertaining whether said low watermark of said local address pool exceeds a low watermark limit; and

means for indicating one or more IP address pools should be reallocated to

20 reclaim IP addresses from the network element associated with said low watermark when said low watermark exceeds said low watermark limit.

70. The apparatus of claim 67 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

0076363014US-0001

said high watermark is expressed as a percentage of allocated IP addresses.

71. The apparatus of claim 70 wherein said network operates according to a simple

5 network management protocol (SNMP).

72. The apparatus of claim 71 wherein

said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

10

73. An apparatus capable of managing Internet Protocol (IP) addresses on a data communications network, said apparatus comprising:

a memory for storing a global IP address pool; and

a global IP pool manager, comprising:

15 an allocator capable of allocating a plurality of local IP address pools, each of said

local IP address pools associated with a different network edge device

capable of accepting connection requests requiring an IP address;

a requestor capable of requesting IP address usage data from one or more of said

network edge devices;

20 a determiner capable of determining whether one or more of said plurality of local

IP address pools should be reallocated based upon at least said requested IP

address usage data;

a reallocator capable of reallocating one or more of said plurality of local IP

address pools based upon said an indication from said determiner; and

09766991-01904  
T09T0-T099260

an updater capable of updating one or more of said local IP address pool

databases and said global IP pool database based upon said reallocating.

5 74. The apparatus of claim 73 wherein

said local IP address pool includes a high watermark that indicates the maximum

number of IP addresses used by said network edge device; and

said determiner is further configured to ascertain whether said high watermark of a

local address pool exceeds a high watermark limit and to indicate IP address pool

10 should be reallocated to give more IP addresses to the network element

associated with said high watermark when said high watermark exceeds said high

watermark limit.

75. The apparatus of claim 74 wherein

15 each said local IP address pool further comprises a low watermark that indicates the

minimum number of IP addresses used by said network edge device; and

said determiner is further configured to ascertain whether said low watermark of said

address pool exceeds a low watermark limit and to indicate one or more IP

address pools should be reallocated to reclaim IP addresses from the network

20 element associated with said low watermark when said low watermark exceeds

said low watermark limit.

RECEIVED  
FEB 24 2014

allocate an IP address from IP addresses reclaimed from other IP address pools when

5 unallocated IP addresses is insufficient;

exceeds said high watermark limit and when the number of unallocated IP

reallocate one or more IP address pools to reclaim IP addresses from a local IP

and said low watermark is greater than said low watermark limit.

each said local IP address pool further comprises a low watermark that indicates the

said determiner is further configured to ascertain whether said low watermark of said

address pools should be reallocated to reclaim IP addresses from the network

20            said low watermark limit.

said low watermark is expressed as a percentage of allocated IP addresses; and

58

79. The apparatus of claim 78 wherein said network operates according to a simple network management protocol (SNMP).

5

80. The apparatus of claim 79 wherein  
said low watermark is stored in an expression MIB; and  
said high watermark is stored in an expression MIB.

10 81. An apparatus capable of managing Internet Protocol (IP) addresses on a data communications network, said apparatus comprising:  
a memory for storing a global IP address pool; and  
a global IP pool manager, comprising:  
an allocator capable of allocating a plurality of local IP address pools, each of said  
15 local IP address pools associated with a different network edge device  
capable of accepting connection requests requiring an IP address;  
a receiving interface capable of receiving a communication from said network  
edge device, said communication including an IP address usage summary;  
a determiner capable of determining whether one or more of said plurality of local  
20 IP address pools should be reallocated based upon said IP address usage data;  
a reallocator capable of reallocating one or more of said plurality of local IP  
address pools based upon said an indication from said determiner; and  
an updater capable of updating one or more of said local IP address pool  
databases and said global IP pool database based upon said reallocating.

82. The apparatus of claim 81 wherein:

said local IP address pool includes a high watermark that indicates the maximum

number of IP addresses used by said network edge device; and

said determiner is further configured to ascertain whether said high watermark of a

local address pool exceeds a high watermark limit and to indicate one or more IP

address pools should be reallocated to give more IP addresses to the network

element associated with said high watermark when said high watermark exceeds

said high watermark limit.

83. The apparatus of claim 82 wherein

each said local IP address pool further comprises a low watermark that indicates the

minimum number of IP addresses used by said network edge device; and

said determiner is further configured to ascertain whether said low watermark of a

said address pool exceeds a low watermark limit and to indicate one or more IP

address pools should be reallocated to reclaim IP addresses from the network

element associated with said low watermark when said low watermark exceeds

said low watermark limit.

84. The apparatus of claim 83 wherein said reallocator is further configured to:

allocate an IP address from IP addresses reclaimed from other IP address pools when

said high watermark exceeds said high watermark limit and when the number of

unallocated IP addresses is insufficient;

allocate an IP addresses from unallocated IP addresses when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is sufficient; and

- 5      reallocate one or more IP address pools to reclaim IP addresses from a local IP address pool when said high watermark is less than said high watermark limit and said low watermark is greater than said low watermark limit.

85. The apparatus of claim 81 wherein

- 10      each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device; and said determiner is further configured to ascertain whether said low watermark of said address pool exceeds a low watermark limit and to indicate one or more IP address pools should be reallocated to reclaim IP addresses from the network element associated with said low watermark when said low watermark exceeds  
15      said low watermark limit.

86. The apparatus of claim 83 wherein

- said low watermark is expressed as a percentage of allocated IP addresses; and  
20      said high watermark is expressed as a percentage of allocated IP addresses.

87. The apparatus of claim 86 wherein said network operates according to a simple network management protocol (SNMP).

88. The apparatus of claim 84 wherein

said low watermark is stored in an expression MIB; and

said high watermark is stored in an expression MIB.

5

89. An apparatus capable of managing Internet Protocol (IP) addresses on a data communications network, said apparatus comprising:

a receiver capable of receiving a communication;

an allocator capable of allocating an available IP address from a local IP address pool

10

if said communication includes a connection request, said local IP address pool associated with a different network edge device capable of accepting connection requests;

a determiner capable of determining whether said local IP address pool should be adjusted;

15

an notifier capable of sending a alarm message to a global IP pool manager when said IP address pool should be adjusted; and

a memory capable of storing an IP address allocation when said communication includes an IP address allocation.

20

90. The apparatus of claim 89 wherein

said local IP address pool includes a high watermark that indicates the maximum number of IP addresses used by said network edge device; and

said determiner is further configured to ascertain whether said high watermark of a

local address pool exceeds a high watermark limit and to indicate one or more IP

TOP SECRET

address pools should be reallocated to give more IP addresses to said network edge device when said high watermark exceeds said high watermark limit.

5 91. The apparatus of claim 90 wherein

each said local IP address pool further comprises a low watermark that indicates the minimum number of IP addresses used by said network edge device; and said determiner is further configured to ascertain whether said low watermark of said address pool exceeds a low watermark limit and to indicate one or more IP

10 address pools should be reallocated to reclaim IP addresses from said network edge device when said low watermark exceeds said low watermark limit.

92. The apparatus of claim 91 wherein said reallocator is further configured to:

allocate an IP address from IP addresses reclaimed from other IP address pools when  
15 said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is insufficient;

allocate an IP addresses from unallocated IP addresses when said high watermark exceeds said high watermark limit and when the number of unallocated IP addresses is sufficient; and

20 reallocate one or more IP address pools to reclaim IP addresses from said local IP address pool when said high watermark is less than said high watermark limit and said low watermark is greater than said low watermark limit.

93. The apparatus of claim 89 wherein

each said local IP address pool further comprises a low watermark that indicates the

minimum number of IP addresses used by said network edge device; and

5 said determiner is further configured to ascertain whether said low watermark of said

local address pool exceeds a low watermark limit and to indicate one or more IP

address pools should be reallocated to reclaim IP addresses from the network

element associated with said low watermark when said low watermark exceeds

said low watermark limit.

10

94. The apparatus of claim 91 wherein

said low watermark is expressed as a percentage of allocated IP addresses; and

said high watermark is expressed as a percentage of allocated IP addresses.

15 95. The apparatus of claim 94 wherein said network operates according to a simple

network management protocol (SNMP).

96. The apparatus of claim 95 wherein

said low watermark is stored in an expression MIB; and

20 said high watermark is stored in an expression MIB.
